setvbuf

`setvbuf` allows us to change the way a stream is buffered and to control the size and location of the buffer. The function's third argument, which specifies the kind of buffering desired, should be one of the following macros:

- `_IOFBF` (full buffering). Data is read from the stream when the buffer is empty or written to the stream when it's full.
- `_IOLBF` (line buffering). Data is read from the stream or written to the stream one line at a time.
- `_IONBF` (no buffering). Data is read from the stream or written to the stream directly, without a buffer.

(All three macros are defined in `<stdio.h>`.) Full buffering is the default for streams that aren't connected to interactive devices.

`setvbuf`'s second argument (if it's not a null pointer) is the address of the desired buffer. The buffer might have static storage duration, automatic storage duration, or even be allocated dynamically. Making the buffer automatic allows its space to be reclaimed automatically at block exit; allocating it dynamically enables us to free the buffer when it's no longer needed. `setvbuf`'s last argument is the number of bytes in the buffer. A larger buffer may give better performance; a smaller buffer saves space.

For example, the following call of `setvbuf` changes the buffering of `stream` to full buffering, using the `N` bytes in the `buffer` array as the buffer:

```
char buffer[N];
...
setvbuf(stream, buffer, _IOFBF, N);
```

`setvbuf` must be called after `stream` is opened but before any other operations are performed on it.

It's also legal to call `setvbuf` with a null pointer as the second argument, which requests that `setvbuf` create a buffer with the specified size. `setvbuf` returns zero if it's successful. It returns a nonzero value if the mode argument is invalid or the request can't be honored.

setbuf

`setbuf` is an older function that assumes default values for the buffering mode and buffer size. If `buf` is a null pointer, the call `setbuf(stream, buf)` is equivalent to

```
(void) setvbuf(stream, NULL, _IONBF, 0);
```

Otherwise, it's equivalent to

```
(void) setvbuf(stream, buf, _IOFBF, BUFSIZ);
```

where `BUFSIZ` is a macro defined in `<stdio.h>`. The `setbuf` function is considered obsolete; it's not recommended for use in new programs.
