(c) Have it stop reading at the first new-line character, then store the new-line character in the string.
(d) Have it leave behind characters that it doesn't have room to store.

Section 13.4

5. (a) Write a function named `capitalize` that capitalizes all letters in its argument. The argument will be a null-terminated string containing arbitrary characters, not just letters. Use array subscripting to access the characters in the string. *Hint:* Use the `toupper` function to convert each character to upper-case.

`toupper` function ➤23.5

(b) Rewrite the `capitalize` function, this time using pointer arithmetic to access the characters in the string.

W 6. Write a function named `censor` that modifies a string by replacing every occurrence of `foo` by `xxx`. For example, the string `"food fool"` would become `"xxxd xxxl"`. Make the function as short as possible without sacrificing clarity.

Section 13.5

7. Suppose that `str` is an array of characters. Which one of the following statements is not equivalent to the other three?

(a) `*str = 0;`
(b) `str[0] = '\0';`
(c) `strcpy(str, "");`
(d) `strcat(str, "");`

W *8. What will be the value of the string `str` after the following statements have been executed?

```
strcpy(str, "tire-bouchon");
strcpy(&str[4], "d-or-wi");
strcat(str, "red?");
```

9. What will be the value of the string `s1` after the following statements have been executed?

```
strcpy(s1, "computer");
strcpy(s2, "science");
if (strcmp(s1, s2) < 0)
  strcat(s1, s2);
else
  strcat(s2, s1);
s1[strlen(s1)-6] = '\0';
```

W 10. The following function supposedly creates an identical copy of a string. What's wrong with the function?

```
char *duplicate(const char *p)
{
  char *q;

  strcpy(q, p);
  return q;
}
```

11. The Q&A section at the end of this chapter shows how the `strcmp` function might be written using array subscripting. Modify the function to use pointer arithmetic instead.

12. Write the following function:

```
void get_extension(const char *file_name, char *extension);
```
